

# Intrusion Prevention Solutions

## Proactive

### Ω Intrusion

The perpetrator illegally enters the premises by, for example, scaling a fence.

### Ω Intruder identification and detection

The perpetrator is detected by video camera and PIR motion sensors or any other detection device.

### Ω Alarm verification

The alarm signals and video footage are received at the interactive off-site remote monitoring control room. The operator takes the appropriate action.

### Ω Intervention

A series of live, personalised warnings are announced from the control room via loudspeakers installed at the monitored premises. These warnings instantly deter most potential intruders and limit the requirement for armed reaction rendering the need for reaction unnecessary, potentially saving huge costs.

**Audio challenging** is the first in several Fight Back Management options.

### Ω Reaction

The control room operators will deploy the required response units (armed response, ambulance, fire brigade etc).

## Immediate Fight Back Technology

Our new technology deploys hindrance (or scare) tactics that are remotely activated to discourage and deter criminal activity. It is a controlled measure to proactively and interactively ensure your safety and render the need for armed reaction unnecessary. Armed reaction can be provided should clients request. The strategy also renders the need for after hour manned guarding unnecessary and potentially saves clients huge costs.

### Ω Audio Challenging

Speakers are placed in strategic positions and proved to be efficient 99% of the time.

### Ω Striker Gas Emitting System

A pepper spray system is remotely activated when intruders enter the premises, discharging gas in multiple bursts, which will incapacitate the perpetrator.

### Ω The Smoke Cloak

Clouds of smoke with a thunder flash are released to impair the perpetrator's vision and incapacitate him. The smoke is not harmful to humans or animals and will not cause damage to property.

What you can't see, you can't steal!

Our technology meets consumer demands with an Interactive Smartphone App that provides the convenience and reassurance of remote arming and disarming of the system.

Video evidence footage can instantly be sent from the control room to the client.
